Graded quiz on Sets, Number Line, Inequalities, Simplification, and Sigma Notation

LATEST SUBMISSION GRADE 100%

1.	Let $B= -$	$\{3, 5, 5, 5, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1,$, 10,	11,	14	. Is the following statement true or false: 3	∉	B
----	------------	--	-------	-----	----	---	---	---

1/1 point

- False
- O True

✓ Correct

The symbol \notin stands for "is not an element of." Since 3 is in an element of the set B, the given statement is not true.

2. Let $A=\{1,3,5\}$ and $B=\{3,5,10,11,14\}$. Which of the following sets is equal to the union $A \cup B$?

- \bigcirc {1, 10, 18}
- \bigcirc {3, 5, 10, 11, 14}
- \bigcirc {1, 3, 5, 10, 11, 14}
- \bigcirc {1, 3, 5, 3, 5, 10, 11, 14}

✓ Correct

The union of two sets consists precisely of the elements that are in at least one of the two sets. That is precisely what is listed here.

3.	How many	real	numbers	are	there	between	the	integers	1	and 4?	,

\odot	Infinitely many
---------	-----------------

- O 2
- O 4
- O None

✓ Correct

There are in fact infinitely many real numbers between any pair of distinct integers, or indeed any pair of distinct real numbers!

4. Suppose I tell you that x and y are two real numbers which make the statement $x \geq y$ true. Which pair of numbers $\underline{\it cannot}$ be values for x and y?

1/1 point

$$\bigcirc \ \, x=2 \text{ and } y=1$$

$$\bigcirc \ x=10$$
 and $y=10$

$$\bigcirc x = 5$$
 and $y = 3.3$

Recall that the statement $x \geq y$ means that x is either equal to y or x is to the right of y on the real number line. Since -1 is actually to the left of 0, these cannot be values for x and y.

5. Suppose that z and w are two positive numbers with z < w. Which of the following inequalities is false?

$$\bigcirc z + 3 < w + 3$$

$$\bigcirc w-7>z-7$$

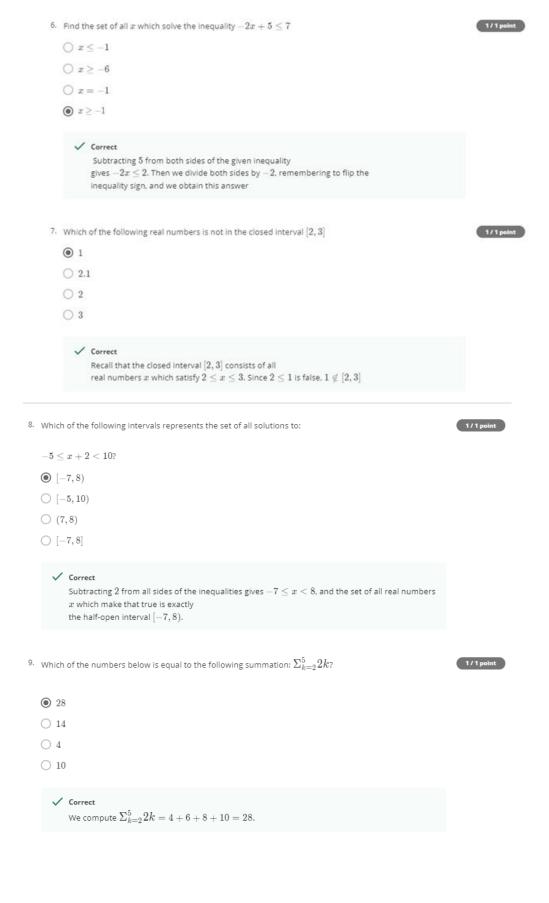

$$-5z < -5w$$

$$\bigcirc \ -z>-w$$

✓ Correct

If we start with z < w and multiply both sides by -5, we need to flip the less-than sign, which would give -5z>-5w. For an

example, try z=1 and y=2 and see what happens!

^{10.} Suppose we already know that $\Sigma_{k=1}^{20}k=210$. Which of the numbers below is equal to $\Sigma_{k=1}^{20}2k$? \bigcirc 210	1/1 point
O 40	
○ 2	
420	
\checkmark Correct By applying one of our Sigma notation simplification rules, we can rewrite the summation in question as $2\left(\Sigma_{k=1}^{20}k\right)=2\times210=420.$	
^{11.} Which of the numbers below is equal to the summation $\Sigma_{i=2}^{10}$ 7?	1/1 point
63	
O 7	
○ 70	
○ 48	
$\begin{tabular}{ll} \checkmark $	

- $\bigcirc \sqrt{14}$
- O 42
- O 69
- 14

✓ Correct

To get the variance of a set of numbers, you need to perform four steps:

First compute the mean (which is 3)

Then calculate all the squared differences between the numbers in the set and this mean (here you get 25, 1, 16)

Then add all these up (here you get 42)

Then divide by the number of elements in the set (which is 3).

Therefore, the variance of ${\cal Z}$

$$\,=\,\frac{1}{3}\left[(-2-3)^2+(4-3)^2+(7-3)^2\right]$$

$$=\,\frac{1}{3}\left[25+1+16\right]=\frac{42}{3}=14$$

13. Which of the following sets does not have zero variance? (hint: don't do any calculation here, just think!)

1/1 point

- \bigcirc {1, 1, 1, 1}
- \bigcirc {2, 5, 9, 13}
- \bigcirc {5, 5, 5, 5, 5, 5, 5, 5, 5, 5, 5, 5, 5}
- \bigcirc {0,0,0,0,0,0,0}

✓ Correct

Intuitively, the numbers in this set are spread out.
